+31 63 837 1696 | naetirat.s@gmail.com | linkedin.com/in/naetirat-songsomboon

Master's student in Computer Science at TU/e with 6 years of professional software engineering experience in the data analytics industry, specializing in software architecture. Built and operated social-media ingestion pipelines processing over 1 million messages per day, normalizing heterogeneous platform data into a single format for downstream analytics teams, and owned the analytics products consuming that data in production across both microservices and serverless paradigms. Passionate about building high-quality software that balances long-term maintainability, healthy stakeholder collaboration, and on-time delivery.

Education

Master's Degree in Computer Science and Engineering,

Netherlands | September 2025 - Present

Eindhoven University of Technology (TU/e)

- Expected graduation: June 2028
- Relevant coursework: Data-Intensive Systems, Architecture of Distributed Systems, Advanced Algorithms

Technical Skills

- **Programming Languages:** Python, JavaScript, TypeScript, Go
- **Frameworks:** Next.js, Fastify, Fiber
- **Databases & Storage:** MongoDB, Redis, MySQL, Google BigQuery, AWS S3
- **Message Queuing:** RabbitMQ, AWS SQS
- **Cloud & DevOps:** Git, Docker, Kubernetes, GitHub Actions, ArgoCD, Grafana
AWS (EC2, ECR, EKS, Lambda, API Gateway, SAM, Amplify)
- **Software Architecture:** Clean Architecture, Modular Monolith, Microservices, Serverless

Work Experience

Senior Software Engineer, Wisesight (Thailand) Co., Ltd.,

Thailand | Jan 2023 - Aug 2025

- Owned two data analytics products end to end in a peer team of 3 senior engineers, from requirements gathering with product owners through feature design, full-stack implementation, and production operations with GitOps and IaC.
- Developed a Go worker pipeline on RabbitMQ consuming 1M+ social-media messages/day into a B2B influencer discovery product, alongside the microservices serving it: a Next.js web app and 4 Go (Fiber) API services, deployed on Kubernetes through GitOps with ArgoCD.
- Protected Kubernetes node stability while giving pods enough resources to run reliably, by measuring average CPU and RAM usage per pod and tuning each pod's resource requests and limits to its measured profile.
- Developed a serverless social media trend analytics product serving 30k+ users: Next.js on AWS Amplify, TypeScript (Fastify) APIs on AWS Lambda and API Gateway, with infrastructure as code on AWS SAM.
- Enabled on-demand AI trend summarization despite processing times beyond AWS Lambda's response limit by designing an asynchronous request-reply flow, computing only on the selections users requested instead of pre-processing the whole growing dataset on a schedule.
- Led the team to restructure both products' codebases for high cohesion and low coupling, improving team velocity and reducing sprint planning time by allowing engineers to identify the scope of impact and distribute workload more effectively.

Software Engineer, Wisesight (Thailand) Co., Ltd.,

Thailand | Jan 2023 - Aug 2025

- Developed a social-media data pipeline collecting over 1 million messages per day from public accounts on Facebook, Instagram, X, YouTube, TikTok, and web sources, normalizing heterogeneous platform payloads into a single centralized format, then storing them in MongoDB and publishing them over RabbitMQ to the teams that consumed them.
- Kept the pipeline within third-party platform rate limits by developing a criteria-based account tiering system covering 300,000+ tracked social-media accounts, with automatic periodic re-tiering and per-tier data freshness windows calculated from API token capacity.
- Owned the pipeline's image-analysis stage: kept message text on the fast path to downstream consumers by duplicating messages so analysis never blocked delivery, re-hosted platform images on S3 to outlive expiring pre-signed URLs, and ran OCR and object detection on all images of a message concurrently.
- Created and maintained the pipeline's per-channel specification documentation and an onboarding process for new engineers; onboarded and trained 3 engineers.
